

# NCI

## Nexus Capital & Investments

### Phase 1 - Research and Build

# 1

#### DATA STUDY AND ANALYSIS

Examine historical market data, charts, and price patterns to identify statistical edges and recurring market inefficiencies. Analyse bulk datasets across multiple timeframes to discover quantifiable trading opportunities.

# 2

#### TEMPLATE CREATION

Convert identified market edges into standardised templates and frameworks that can be systematically implemented. Structure the trading logic into reusable building blocks for the algorithm builder.

# 3

#### DATA QUALITY CHECKS

Source market data from brokers and Dukascopy, then validate accuracy, completeness, and consistency. Ensure data integrity and proper correlation with our trading platform before implementation.

# 4

#### IS AND OOS TESTING

Select appropriate In Sample and Out of Sample periods to ensure coverage across different market regimes and conditions. Critical for preventing data mining bias and validating strategy robustness in varying market environments.

# 5

#### DATA MINING PRE-FILTERING

Deploy Strategy Quant to systematically discover algorithms using our predefined templates as guidance. Apply ranking filters to remove anomalies and poor-quality strategies during the automated generation process.

# Phase 2 - Robustness Testing

# Phase 3 - Demo Testing

## BROKER TICK DATA BACKTEST

Validate Strategy Quant results by running identical backtests on broker data over the same time period. Ensures performance consistency within reasonable tolerance levels and confirms the algorithm translates accurately to the actual trading environment.

## FORWARD DEMO TESTING

Execute the algorithm on live demo accounts to validate real-time performance matches backtested expectations. Confirms proper implementation, signal execution, and strategy behavior under actual market conditions without risking capital.

## APPROVED ALGO LIBRARY

Central repository for storing validated algorithms that have passed all testing phases. Continuously maintained by adding newly approved strategies and removing underperforming or outdated algorithms to ensure only the highest quality trading systems remain active.

## DRAWDOWN STANDARDISATION

Adjust approved algorithms to achieve standardised historical drawdown levels of 5% (3% for larger capital accounts). Ensures consistent risk exposure across all strategies and allows for proper portfolio allocation and risk management.

## PORTFOLIO CREATION

Utilise Strategy Quant's Portfolio Master to automatically identify optimal trading strategy combinations by evaluating all possible portfolio permutations. Features sector filtering, correlation analysis, and condition-based filtering to create the most effective portfolio while managing risk across symbols and sectors.

# Phase 4 - Deploy to Live
